

MIDWEST HYPERBARIC INSTITUTE P.C.

### **Protocol for HBOT Study for TBI**

- A history of closed head injury or concussion.
- Evaluated and diagnosed with listed deficits or complaints by an accredited institution or trained individual.
- Evaluated by doctors at Midwest HBOT and findings correlated with Veteran's group, to be sure patient qualifies for study.

### **Treatment Protocol**

- Review previous history and workup.
- SPECT scan done by Dr. Dan Pavel.
- 40 hyperbaric treatments, 5 days a week for 60 minutes each at 1.5 ATA (Can be once daily or twice daily with 3 hour gap between treatments).
- Do post-treatment SPECT scan and evaluation by persons or facility who did pre-treatment evaluation.
- Attempt to get evaluation from family and friends as to what they have noted.

We have funding for 20 veterans, and expect that the persons selected for treatment follow through the entire program. Partial course of therapy is of no value and would reduce the number of veterans who could benefit from the therapy.

If you believe that you or a loved one may be a candidate for this study, please contact Dr. August Martinucci, MD at (630) 378-1760.
